1. Evaluation of product process.....	3
2. Evaluation of team.....	5
3. Self-evaluation	6
4. Quality of documentation	7

Introduction:

- This is my article on Enterprise Web Software Development, which is divided into three sections: project evaluation, team evaluation, and self-evaluation. The next item on the agenda is our team's evaluation.

1. Evaluation of product process.

- We will discuss my product, and I will provide an overview of the project that our group completed.
- We use the Sprint backlog, we work as a team with six people. We have divided the work for each person on the team such as: data designer, web designer, programmer, group report writer and a leader.
- We will start talking about websites, websites designed by UI-UX. It is suitable for devices such as laptops, cell phones, and desktops with different display sizes. We integrate plugins and libraries that use CSS3, HTML5, BootStrap and JavaScript to make the web more dynamic and interesting.
- About back end the PHP programming language ensures that the website runs smoothly and loads data quickly. Customers feel that web pages on the computer are easier to access than normal websites due to loading and viewing files before downloading data from the server. Also, use Codeigniter library to improve caching, eliminate redundant resources and speed up queries.
- MVC is a common platform for developing mobile and web applications. Creation is independent of each other due to the isolation of multiple components (view, business logic, and storage). As a result, the maintainability, flexibility, and scalability of the device improve, and the code becomes simpler and easier to read.
- Our product cannot be finished fully due to a lack of expertise. We are completing the product 80 percent at basic level, here is some functionality that we do all the specifications.
- I believe my team is doing a fantastic job on the back-end and database because we have one person in our team who knows a lot about it, and our group has created an app that is easy to navigate and understand.

1.1 Meeting

- **Daily Standup**

- Aids in the tracking of each member's everyday work progress. Furthermore, we will determine the nature of each job's dilemma in order to have timely solutions.

- **Sprint Review**

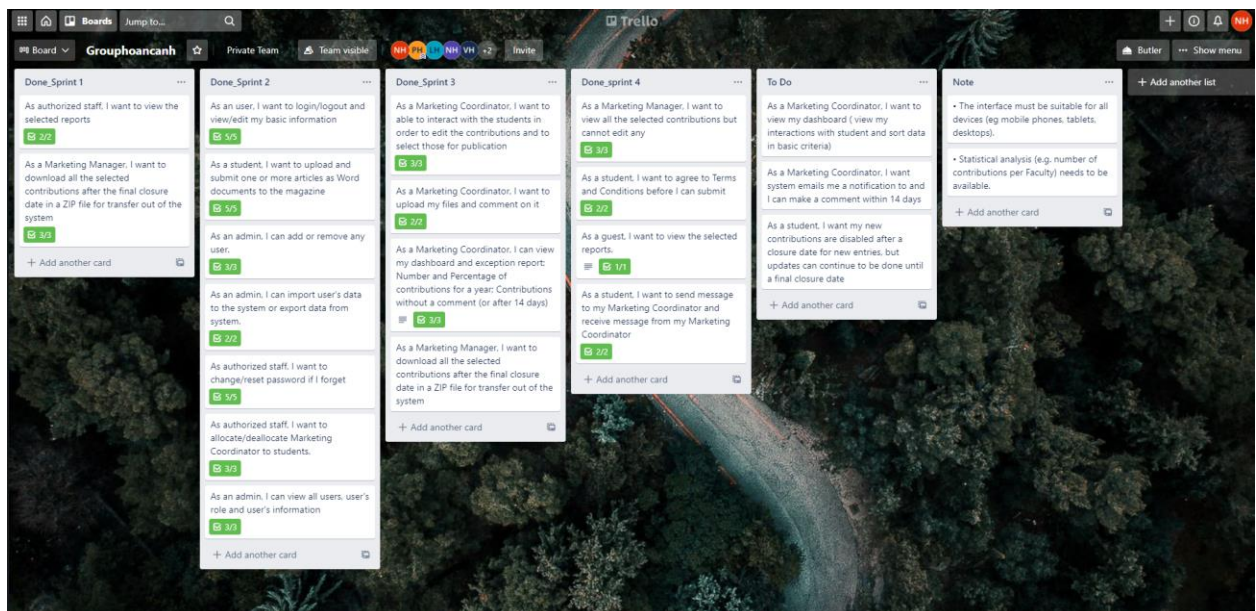

- Examine the work that was completed during the sprint. Around the same time, better grasp the unfinished job, study and come up with ideas for the next Sprint.

- **Sprint Retrospective**

- Allow personal observations about the job, as well as ideas for making future work more manageable. In addition, we will provide job experience to other team members, allowing them to stay together, better understand each other, and accomplish the project's objectives.

1.2 Sprint Backlog

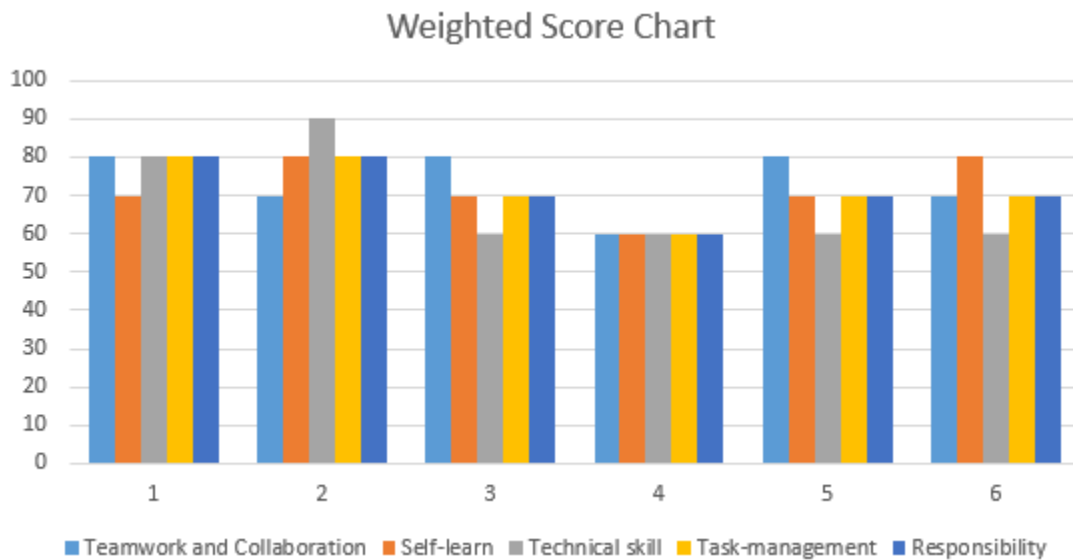

- The Sprint's Product Backlog products are chosen and used. The category strategy table will be broken down further, and each team member will be allocated to a specific category.

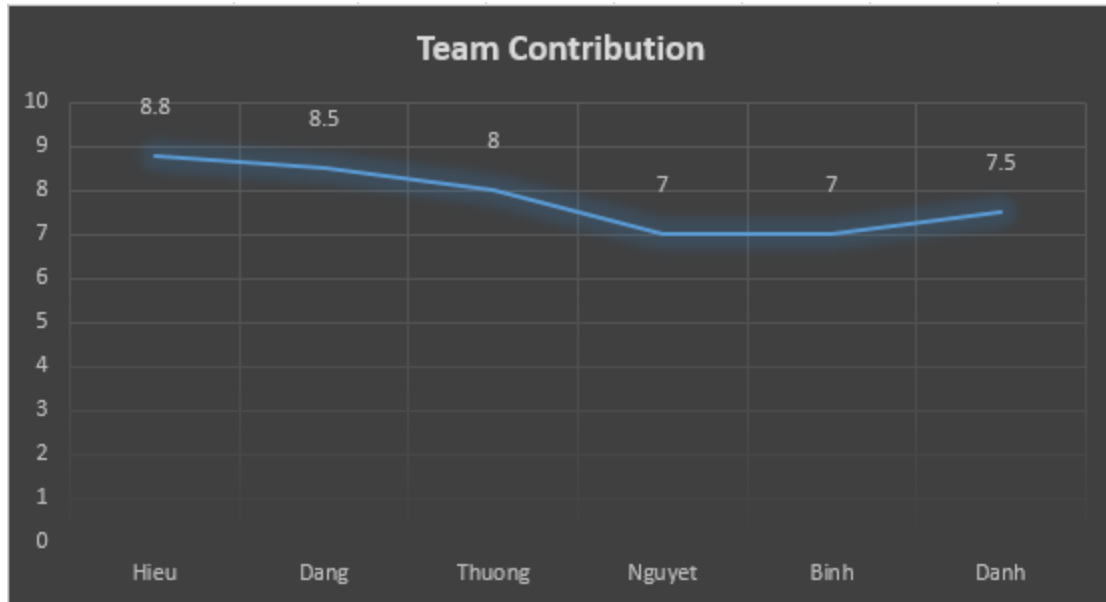

2. Evaluation of team.

- Here are score statistics on some aspects of each team member .

Criteria	Weight	Hieu	Dang	Thuong	Nguyet	Binh	Danh
Teamwork and Collaboration	20%	80	70	80	60	80	70
Self-learn	10%	70	80	70	60	70	80
Technical skill	20%	80	90	60	60	60	60
Task-management	20%	80	80	70	60	70	70
Responsibility	30%	80	80	70	60	70	70
Total	100%	79	80	70	60	70	70

- This is our team's analysis, and after we've completed the conference, we've decided that Minh Dang will be leader. Dang has a lot of professional experience and suggests that we split the team into separate positions and divide the work into various sprints.
- To code, our team is split into two groups: front-end and back-end. The database, back-end code, and use-cases will be handled by the back-end team, while the front-end code, API, debugging, and test logs will be handled by the front-end team. About every task is divided among the squad, and our team leader has been extremely helpful. We are attempting to use Advance.Net, with Dang in charge of the back-end and Dong in charge of the front-end. They're all good coders and diligent workers. As a result, coding is not a challenging task for us. The task has been split into sprint teams, and after each sprint team has completed its work, I will hold an online meeting to recap before the deadline. Everyone is doing a fantastic job, and we're all trying to work together and collaborate and get the job done.

3. Self-evaluation

- This is the last section of my self-evaluation. I need to put more emphasis on teamwork. I'm the one who writes the meeting report's introduction and creates the site diagram. I drew a bad site map, which caused Thuong to tell me to fix it, and I didn't do it well

enough, so Thuong had to fix it for me. I'll work harder to improve myself; this challenge is a lesson for me; I need to plan more and learn more in order to finish the job.

4. Quality of documentation

Report abide some rules:

- Outside of the group, do not share any of the resources, including the references.
- Use the Calibri font with a 12 font scale and 1.5 line spacing.
- Use the paragraph writing guideline (between 5 and 7 sentences) and match the sides.
- Make use of image captions and a form list.
- Under university formatting guidelines (Summary, Table of Contents, etc.).
- Cite any of the sources.
- Minimize spelling and grammar mistakes.
